📦 Pattern Painter

Quick Start Guide.

Pattern Painter is a Unity Editor tool to help you speed up your level design, prototyping and game development workflows.

It empowers you to efficiently place GameObjects in your scene in various geometric patterns:

1. Open Pattern Painter from Tools > Pattern Painter.
2. Drag the Paint Volume over the surface you want to paint (or select objects and press Fit Volume to Selection). Every surface inside it serves as the base for the pattern.
3. Project a pattern of "Placement Points" onto the surfaces inside the Paint Volume and tweak the pattern to your specific needs.
4. Assign a Prefab and press Create Prefabs at Placement Points to place a copy at each Placement Point, then optionally change their rotation and alignment.

Every run can be undone in one step with Ctrl+Z (Cmd+Z on Mac).
